

PHISHING SIMULATION CAMPAIGN REPORT

User Awareness and Education Assessment

Confidentiality Notice

This report is intended for internal organizational use. It documents an authorized phishing simulation campaign conducted for awareness, education, and control improvement purposes. Replace all placeholders with the organization’s actual campaign data before final circulation.

Organisation	Cybermind-Security Tech.
Campaign Type	Internal phishing simulation for user awareness and education
Simulation Platform	Zphisher (authorized internal use only)
Assessment Window	May 2, 2026
Awareness Window	May 10, 2026
Measured KPIs	Click rate, credential submission rate, reported rate
Prepared By	Adabanija Toheeb
Report Date	May 22, 2026

Prepared for: Cybermind-Security Tech.

Prepared by: Adabanija Toheeb

1. Executive Summary

This report presents the results of an internal phishing simulation campaign conducted to assess user susceptibility to phishing attempts and to measure the effect of targeted awareness and education activities. The campaign was executed in an authorized organizational context and evaluated user behavior before and after the awareness intervention.

The primary purpose of the exercise was to establish a behavioral baseline, deliver corrective awareness content, and then determine whether measurable improvement occurred across key indicators of phishing resilience. The report focuses on three core KPIs: click rate, credential submission rate, and reporting rate.

2. Objectives

- Measure the initial level of user susceptibility to phishing messages.
- Assess whether awareness and education activities improve safe user behavior.
- Track changes in click behavior, credential submission behavior, and incident reporting behavior.
- Identify areas where additional user education, reporting guidance, or control reinforcement may be required.

3. Scope and Approach

The campaign covered a controlled phishing simulation designed for internal awareness testing. A pre-awareness phishing exercise was conducted to establish a baseline, followed by awareness and education activities. A post-awareness exercise was then used to measure behavioral change against the same KPI categories.

Ethical and Governance Note

The simulation must be supported by management approval, defined scope, and clear rules of engagement. This report intentionally describes the exercise at a high level and does not include technical details that would enable misuse.

4. Methodology

- Baseline simulation: A controlled phishing message was distributed to the in-scope audience to measure initial behavior.
- Measurement: Baseline KPI values were recorded for click rate, credential submission rate, and reporting rate.
- Awareness intervention: Users received awareness and education content focused on phishing identification, safe response behavior, and internal reporting procedures.
- Post-awareness simulation: A follow-up phishing simulation was conducted to evaluate behavioral change after the intervention.
- Comparative analysis: Before-and-after KPI values were reviewed to determine the effectiveness of the awareness programmed.

5. KPI Definitions

- Click Rate: The percentage of targeted users who clicked the phishing link or interacted with the simulated malicious prompt.
- Credential Submission Rate: The percentage of targeted users who entered credentials or other sensitive information into the simulated phishing page.
- Reported Rate: The percentage of targeted users who identified the message as suspicious and reported it through the approved organizational reporting channel.

6. KPI Comparison

Populate the table below with the campaign's measured values. In general, successful awareness outcomes should show a reduction in click rate and credential submission rate, together with an increase in reporting rate.

KPI	Before Awareness	After Awareness	Change	Interpretation
Click Rate	90 %	10%	80%	Lower values indicate improved user caution.
Credential Submission Rate	70%	10%	60%	Lower values indicate reduced compromise likelihood.
Reported Rate	20%	90%	70%	Higher values indicate stronger security awareness and escalation behavior.

7. Analysis of Results

Use this section to interpret the measured changes. Lower click and credential submission rates typically indicate improved user caution, message scrutiny, and understanding of phishing indicators. A higher reporting rate usually indicates that users are not only identifying suspicious content but are also following the organization's escalation procedure correctly.

- **Baseline risk indicator:** The baseline phishing simulation revealed a high level of organizational cyber risk prior to awareness training. Approximately **90%** of participants clicked on the phishing email, while **70%** proceeded to submit their credentials, indicating a significant susceptibility to phishing attacks. Furthermore, only **20%** of users reported the suspicious email, suggesting limited awareness of incident reporting procedures and phishing indicators.
- **Post-awareness improvement:** Following the cybersecurity awareness program, measurable improvements were observed across all key performance indicators. The phishing **click rate decreased from 90% to 10%**, representing an **80 percentage-point reduction**, while the **credential submission rate dropped from 70% to 10%**, a **60 percentage-point reduction**. Additionally, the **reporting rate increased from 20% to 90%**, reflecting improved employee vigilance and greater adherence to the organization's incident reporting process. These results demonstrate that the awareness initiative significantly enhanced users' ability to identify and respond appropriately to phishing attempts.
- **Residual concern:** Although the awareness campaign substantially reduced phishing susceptibility, **10% of participants still clicked on phishing links and submitted credentials**. This indicates that a small proportion of users remain vulnerable to social engineering attacks. These users should receive targeted follow-up training, periodic phishing simulations, and closer monitoring to further reduce organizational risk.
- **Operational implication:** The results indicate a considerable improvement in the organization's cybersecurity awareness and phishing resilience. Reduced click and credential submission rates lower the likelihood of successful phishing attacks, while increased reporting behavior enables faster detection and response by the security team. Continued awareness campaigns, combined with regular phishing simulations and role-based training, will help maintain and further improve the organization's security posture.

8. Key Findings

- The phishing awareness campaign significantly reduced the phishing email click rate from **90% to 10%**, demonstrating an **80 percentage-point improvement** in user caution.

- Credential submission decreased from **70% to 10%**, indicating a substantial reduction in the likelihood of account compromise during phishing attacks.
- The phishing email reporting rate increased from **20% to 90%**, showing improved employee awareness and compliance with incident reporting procedures.
- A small percentage (**10%**) of participants remained susceptible to phishing attacks, highlighting the need for continuous awareness training and targeted remediation for higher-risk users.

9. Recommendations

- Continue periodic phishing simulations to reinforce awareness and measure long-term behavioral trends.
- Provide targeted retraining for users or departments with higher click or credential submission rates.
- Improve internal reporting visibility by making the reporting process simple, visible, and routinely practiced.
- Align phishing awareness content with common lures relevant to the organization's business context.
- Track KPI trends over time and report them to management as part of the broader security awareness program.
- Consider supplementary technical controls such as email filtering, warning banners, MFA enforcement, and conditional access where applicable.

10. Conclusion

The phishing simulation campaign provides measurable insight into user phishing resilience and the effectiveness of awareness interventions. When supported by management sponsorship, repeated assessment cycles, and clear reporting procedures, phishing simulations can significantly improve organizational readiness against social engineering threats.

This report should be finalized by inserting the actual KPI figures, supporting screenshots, campaign dates, and any audience-specific observations prior to presentation to management or inclusion in the organization's security awareness records.

Appendix A. Screenshot Placeholders

Replace the placeholders below with screenshots from the authorized campaign evidence set. Suitable examples include dashboard summaries, awareness materials, reporting workflow examples, or campaign analytics views.
